

ABSTRACT OF THE DISCLOSURE

A mini stepper includes a base, a shaft tube having a first end secured on a first end of the base, a support rack detachably mounted on a second end of the base, and a support member mounted on a connection of the first end of the shaft tube and the first end of the base. Thus, the mini stepper has a larger contact area with the ground, so that the mini stepper is supported on the ground rigidly and stably, thereby facilitating the user operating the mini stepper.
